Pan Yiming

Education

Vienna Graduate School of Finance — Vienna, Austria
PhD in finance — 2022–2027(expected)

- Research Interests: Empirical Asset Pricing, with a focus on trading frictions, market structure, and return predictability

Universitat Pompeu Fabra — Barcelona, Spain
MRes in Economics, Finance and Management — 2021–2022

Barcelona Graduate School of Economics — Barcelona, Spain
M.S. in Economics and Finance — 2020–2021

Xi'an Jiaotong University — Xian, China
B.S. in Engineering — 2012–2016

Industry Experience

Deep Learning Algorithm Engineer — China
NetEase, HelloBike, Tupu Technology — 2016–2020

- Developed deep learning algorithms for facial recognition and object detection, with a focus on large-scale data processing and deep learning model development.

Research

Lendable Inventory Concentration, Recall Risk, and Equity Pricing Anomalies *(Job Market Paper, sole-authored)*

A short seller needs borrowed shares until the mispricing corrects, but lenders can recall them at any time. Where lendable inventory is concentrated (IC) across lenders, one lender's withdrawal can recall more shares than borrowers can replace in time. Within firms, a one-standard-deviation higher IC predicts a 2.1 percentage point higher next-month

recall probability (mean 10.9%), controlling for the fee and lendable supply. This recall risk deters short selling: the same overpricing signal implied by anomalies attracts about one quarter as much short interest at the highest IC as at the lowest IC, although unused shares are available. As a result, less of the overpricing is corrected: monthly anomaly spreads are 0.43% larger in the top than in the bottom IC quintile, mainly through the short leg, and remain 0.33% larger net of fees. Russell 3000 inclusion, which broadens the lender base, lowers recall risk and raises short interest most in overpriced stocks with high pre-inclusion IC. Beyond the fee, inventory concentration makes access to lendable shares less durable, which deters short selling and sustains anomaly-related overpricing.

Presentations: VGSF PhD Research Seminar 2025; VGSF Conference 2025; EFMA 2026; VGSF Conference 2026; AWG Workshop 2026 Graz; EUROFIDAI–ESSEC Paris December 2026 Finance Meeting (scheduled); AFA 2027, Washington, D.C., Poster Session (scheduled).
Awards: GARP Risk Management Award, EFMA 2026.

Short-Sale Constraints and the Return Predictability of Idiosyncratic variance: Evidence from Crypto Perpetuals(with Jia Zhai)

High idiosyncratic variance predicts low future returns in cryptocurrency markets, and the relation comes from large, recent upside price shocks in coins that cannot be shorted. To study this relation, we use the staggered expansion of access to short selling across coins and compare the same coin's returns after shocks before and after it can be shorted. After upside shocks, prices reverse over the following week, and access to short selling reduces this reversal by 2.55 percentage points, about three quarters of its size. After downside shocks, by contrast, access matters mainly when the decline follows an upside shock. Consistent with these results, access also weakens the return predictability of recent upside shocks, by a similar amount. Idiosyncratic variance thus predicts lower returns in part because, when pessimistic investors cannot sell short, prices rise above the level implied by the average belief after a shock and fall back as disagreement fades.

Prediction Targets for Cross-Sectional Bond Selection (working in progress)

Machine-learning models are trained to forecast returns but used to form long–short portfolios, which earn only relative returns. In corporate bonds, a return target tilts the ranking toward systematic risk: its long–short portfolio has a bond-market beta of one. Holding the model and data fixed, I instead target the probability that a bond beats the cross-sectional median. The beta halves, the Sharpe ratio rises from 1.17 to 2.21, and the rank information coefficient from 0.14 to 0.20. Predicting a positive return under the same loss does not improve the ranking, so the gain comes from the relative threshold, not classification.

Conference Presentations and Seminars

2027 American Finance Association (AFA) Annual Meeting, Washington, D.C. (Poster Session; scheduled).

2026 EUROFIDAI–ESSEC Paris December Finance Meeting (scheduled); European Financial Management Association (EFMA) Annual Meeting; AWG Workshop, Graz; VGSF Conference; WU Finance Brown Bag Seminar; VGSF Seminar in Advanced Topics.

2023–2025 VGSF Conference; VGSF PhD Research Seminar; VGSF Seminar in Advanced Topics (annually).

Teaching, Supervision and Professional Service

- **Instructor** at Vienna University of Economics and Business — Winter 2023 – Summer 2026
  SBWL Finance III: Corporate Finance (6 semesters); teaching evaluation: 1.4/5.0 (1 = best)
- **Bachelor Thesis Supervisor** at Vienna University of Economics and Business — Summer 2024, Summer 2025
  Topics in empirical asset pricing
- **Seminar Organizer** at Vienna University of Economics and Business — Winter 2025 – Summer 2026
  Brown Bag Seminar

Skills

- **Programming:** MATLAB, Python, R
- **Latex:**(intermediate)

Languages

- **Mandarin:** Native
- **English:** Fluent

Scholarships and Awards

- Siyuan Scholarship (Xi'an Jiaotong University) — 2012–2013
- Siyuan Scholarship (Xi'an Jiaotong University) — 2013–2014
- UPF GPEFM FELLOWSHIP (Universitat Pompeu Fabra) — 2021–2022
- Ph.D. scholarship (Vienna Graduate School of Finance) — 2022–2027
- GARP Risk Management Award, EFMA ($2,500) — Kristiansand, Norway, 2026
- AFA Travel Grant ($800) — Washington, D.C., 2027
